

Installation & User Instructions for the Solvent Sentry™ X Level Sensor

1

The sensor housing must hang flush from either side port of the 5-gallon Justrite® can.

2

Plug the hub into a wall outlet or computer USB port, ensuring it's within 150 feet (50m) of the sensor. The hub can pair with up to 100 sensors.

3

To pair sensor and hub press "pair" button on the hub until yellow light illuminates. Hold the included magnet near the indentation on the front of the sensor housing until the green light flashes. When the light on the hub turns from yellow to green, items are paired.

4

To unpair, press the "unpair" button, following the same steps as pairing.

5

The sensors wake up every 9 minutes to check the liquid level. If no liquid is detected, they go back to sleep. If liquid is detected, they alarm continuously until liquid is no longer present.

6

After the sensor turns off, the hub continues to alert for about 5 more seconds.

7

When Justrite can fills and sensor sounds, remove sensor housing and hang on different can which is empty.
